

# Reverse Osmosis Treatment System

Increase boiler cycles of concentration using high purity makeup water.

D & L Water Control, Inc. has expanded its equipment capabilities to include reverse osmosis and ultra filtration water treatment systems to assist our customers makeup water pretreatment requirements. The systems are designed to either replace or complement your current treatment system, on a short or long term basis. As plant water needs can fluctuate greatly, the systems are designed to accommodate almost any configuration.

Plant water source problems are inconvenient and costly. The use of Reverse Osmosis systems installed on boiler makeup water can provide substantial cost savings. The RO units can reduce blow down which saves fuel, water and chemical costs. We provide support, maintenance, and assistance throughout the installation and operation process.

The Reverse Osmosis Units are constructed with the best quality electronics, housing units and membranes. In place cleaning tanks and pumps complement the system to provide the customer with a turn key operation which integrates easily with the current water treatment system.

The RO Systems have a typical return on investment of less than a year.

D & L Water Control, Inc. Is a small, privately held company that takes great pride in it's ability to satisfy it's customers by offering custom, quality driven attention and service.

We have created several Reverse Osmosis Savings Calculators for you to determine the actual savings for your facility. The steam production and current boiler cycles of concentration are simply entered into the

calculator and the savings of fuel, water and chemical are provided at the bottom of the form. DLWC has also provided a Green Savings Quotient (GSQ) that enables you to forecast the carbon footprint reduction for your facility.
